SUMMARY

Backend developer at ABS LAB. In six months I worked on four commercial systems now running in production — an AI-powered marketplace, an ERP on Frappe/ERPNext, a Service Desk and a data center construction management system — building two of them alone or almost entirely myself. Backend in Python and TypeScript, interfaces in React and Vue, integrations with external APIs, payment systems and hardware, deployment on Linux with Docker and CI/CD.

EXPERIENCE

Backend Developer — ABS LAB LLP, Astana (Astana Hub resident)

April 2026 — present

StroyMarket — building materials marketplace with an AI assistant — Lead developer

Production environment with a real seller · stand.kenenai.com

- Built an AI assistant on Google Gemini (function calling, ~20 tools) that calculates materials, fills the cart and takes Kaspi payment in the chat.
- Medusa v2 backend: 17 domain modules, ~70 workflows, multi-vendor with data isolation, a custom Kaspi Pay provider.
- Back office: order picking, logistics, PDF documents, AI invoice recognition; connected the 1C warehouse to the marketplace.

Stack: Node.js, TypeScript, Medusa v2, Next.js 15, PostgreSQL, Redis, Docker, Jest (114+ test files)

Komek Desk — Service Desk for an industrial company with 12 branches — Sole developer

In production · komekdesk.kz

- Built an IT support portal in React 19 + TypeScript on top of GLPI 11 via its REST API: tickets, roles, quality rating (CSAT).
- Management analytics: KPIs, median response and resolution time, workload heatmap, specialist performance.
- Deployed with Docker and Nginx (SSL, rate limiting), set up GitLab CI and daily backups kept for 14 days.

XTS — ERP for a telecom contractor — Team member

In production · thousands of orders from two mobile operators processed

- Automatic order import from operator portals (REST API, JWT with token rotation, no duplicates): manual transfer eliminated.
- Multi-stage order workflow in ERPNext: ~10 roles, warehouse and region permissions, notifications, warehouse and purchasing.
- React 19 + TypeScript dashboard: order funnel, plan vs actual, gross profit, P&L, Excel export.

Stack: Python, Frappe/ERPNext, MariaDB, React, TypeScript, Recharts, Google Sheets API, Nginx

DC Control — data center construction management — Team member

Running on a real construction site · 655 employees in the database

- Timesheets from Hikvision FaceID terminals: a Python agent pushes events from the site's local network over HTTPS.
- Work orders, a materials warehouse with consumption norms and negative-stock protection, equipment tracking, Excel reports.

Stack: Python, Frappe v15, MariaDB, Redis, Vue 3, PrimeVue, Hikvision ISAPI, Caddy

Intern — NITEC, Communications Department

2025

- Grafana dashboards for real-time network monitoring; Python parsers for Juniper routers to collect operational metrics.

SKILLS

Languages	Python, TypeScript, JavaScript, Dart, SQL
Backend	Frappe / ERPNext, Node.js, Medusa v2, Django, REST API, JWT, OpenAPI
Frontend	React, Next.js, Vue 3, Vite, Ant Design, PrimeVue, Tailwind CSS, Recharts, Flutter
Databases	PostgreSQL, MariaDB / MySQL, Redis, MongoDB
DevOps	Linux, Docker, Nginx, Caddy, GitLab CI, GitHub Actions, Grafana, Prometheus
Integrations	Kaspi Pay, Hikvision FaceID (ISAPI), GLPI, Google Gemini, 1C (HTTP services)

EDUCATION

Astana IT University — Bachelor's degree, Software Development

2023 — 2026

- **GymFlow** — diploma project (built with a partner): a Flutter app for meal tracking with calories and macros and a goal-based workout plan.
- Coursework: a TensorFlow book recommendation system, a Kazakhstan history learning website (Node.js, Django).
